Signal Acquisition Mode Selection:

Full-Search: All PRN signals are searched.
Fast-Search: Only signals of visible satellites are searched for fast acquisition. The visibility is estimated with CPU time, last or current FIX position, almanac or ephemeris of each satellites. The Doppler also is decided by last or current reference oscillator freq. offset. So, if FE changed, use Full-Search.

FFTW Wisdom Path:

FFTW wisdom file path to shorten the signal acquisition time. The file can be generated by the utility `fftw_wisdom` in the Pocket SDR package.
